Custom multimodal e-books, did you read the spelling correctly? M-O-D-A-N, not the E-F. That's not a spelling mistake. Yes.

Multimodal model? Something like all e-books originating from different types of sources. Multimodal means it includes multimedia. Multimedia of videos.

Yeah. Okay. Right? So, that is one part of it.

So, broadly from a technology point of view, it is XML is the only ingredient. So, did you go through the full XML content? So, there was one attachment that was there in one of the slides, which talked about content repurposing. Okay.

So, what we are saying is that, firstly, there will be something like a, let us call it as a content bank. Okay. So, you will have lots of small, small content elements.

Okay. Then what we will do is, we will create a custom e-book, okay, which will pull content from your content bank and create a customized e-book. Right? So, for example, right, so you can say that, you assume even if it is not multimodal, you assume that it is just a book.

Okay. Now, you can have lots of say database books. Navate book is there.

Yes. Korth book is there. Raghuramakrishnan book is there.

So, from all those books, I should be able to say I am interested in studying deep over transaction processing. Then what I will do? I will pull transaction processing chapter from Navate book, from all the books I pull and then I will create my own reading material on transaction processing. Okay.

So, that is your customized e-books that you are trying to create. So, this is your overall project, right, and considering the overall capabilities and so on. So, XML is the most suitable data model for this.

Right? So, XML will be used to organize this, to organize this and all. So, this is, lots of interesting things will come in this. So, you will have to build the system to organize, we will use the term content chunks.

Okay. So, this, let us call this as a chunk db. You will have a database of chunks.

Okay. So, and then probably you will have a book db, e-book db. Okay.

So, this will be, one database will be there, this will be another database. Right? So, all these books will go and sit here, all the chunks will go and sit here. Yes.

So, you have to build an application which will be used. Right? So, you have to take out the content from that one and store it in this one. You have to assemble.

Assemble. So, this is, yeah. So, this is, if you call this as chunking, this is assembly.

Okay. You have to assemble. So, these chunks are essentially the multimodal factor.

Exactly. So, these chunks can be of different modalities. All right.

So, there can be, you know, if you take the same transaction processing example, there can be a video on transaction processing. Yes. That I should be able to provide.

So, basically these chunks will, can be in any format. Or we can divide the format. That is right.

It can be in any format. When we are calling it as multimodal, it will be in any format. Okay.

So, now you can imagine, right. So, from a functionality point of view, you will have to do basically CRUD on both these. Right.

So, you should allow an author to upload chunks. Okay. Yes.

Right. And then you should allow a buyer to search through the chunks and create their own books. Correct.

So, the world key stakeholders here. Right. So, there will be author.

Author. He is one stakeholder. Author will contribute to the.

To the chunks. To the chunks. Okay.

Then you will have the buyer. Buyer. Okay.

So, the buyer will buy the books. Will not only just buy the books. Buyer will assemble and buy the books.

Okay. Right. So, the, this key sequence will be search, assemble, buy.

This is similar to an e-commerce. Exactly. Add to cart.

Exactly. This is, this assembly is add to cart. But sir, in that case, does not the buyer need to access this? Only the.

Who will add? Yes, ma'am. This arrow mark indicates who will contribute. Got it.

Got it. Author will contribute to the chunks. Creating the chunks.

Creating the chunks. Buyer will buy. So, they will do the search, assemble, buy.

This will be a three step process. Okay. You can add a little bit of an e-commerce twist to this by

sizing them.

You add a price to the chunks. Okay. Customize.

Correct. You add a price to the chunks and it will go there. Then when I am buying out, so there will be a checkout process.

And this section will work as a cart or something like. It can. It can.

It can. It can be modeled like a cart. We are searching here and adding here.

Yeah. I mean cart is not really the way I would want to look at it. Because the small difference is that the cart concept is useful only for payment.

But subsequently each product is different. They are not attached to each other. Yes, sir.

Permanently. Yes, sir. Here these chunks are attached together.

Yes. Permanently in the form of a book. Correct.

Okay. So, that is a small difference. That is why I did not use the term cart here.

It is assembly. Okay. So, eventually you will assemble and you say, okay, great, this is your book.

This is how much it is going to cost. Okay. And the search section will be for a specific thing like for example, if searching for some series.

Metadata. Exactly. So, you have to associate metadata with the chunks.

Yes. Basically at one time it will target only one specific thing. No.

For search section. Same. Now you will use the shopping cart analogy.

I will keep searching. I will keep adding. So, for assembly thing like.

For assembly thing. For assembly thing it should be same topic or something. Not necessary.

Give the freedom to the user. That is up to you. I gave transaction processing as an example.

I may say transaction processing and concurrent processing. I may choose to do whatever I want. It is exactly the same.

Now you imagine the shopping cart interface. Right. So, there is no restriction now.

Yes. I will keep on searching on various various things and then I will say add to cart. So, the add to cart functionality you can say add to custom e-book.

I will keep searching add to custom e-book. Add to custom. So, there will be one.

You can assume there is only one add to custom e-book.
